

STRATEGIC BANKING PARTNERSHIP PROPOSAL

UNIFYING SECURE COLLABORATION AND DIGITAL ENTERPRISE BANKING SERVICES

PREPARED FOR:
ZENITH BANK PLC (eCOMMERCIAL & DIGITAL BANKING DIVISION)

SUBMITTED BY:
NOTESTANDARD TECHNOLOGIES

DOCUMENT REF: NST-ZBP-2026-001 | DATE: JULY 2026

CLASSIFICATION: RESTRICTED / COMMERCIAL-IN-CONFIDENCE

July 7, 2026

To,
The eCommerce & Digital Banking Division,
Zenith Bank Plc,
Victoria Island, Lagos, Nigeria.

Dear Sir/Ma,

SUBJECT: PROPOSED STRATEGIC BANKING PARTNERSHIP & PAYMENT API INTEGRATION

NoteStandard Technologies is pleased to submit this partnership proposal to Zenith Bank Plc. We have built an operational, secure enterprise collaboration workspace that unifies dynamic notes management, real-time messaging, organizational feeds, and peer-to-peer WebRTC video/audio communications.

As our enterprise customer base expands, we seek to align our core payment operations with Zenith Bank's digital collections network. Through this relationship, we intend to integrate Zenith Bank's card checkout and collections APIs to automate license payments, settle subscriptions, and lay the foundation for joint B2B billing utilities.

By partnering with Nigeria's leading eCommerce bank, we gain access to robust settlement infrastructures while Zenith Bank captures high-frequency, secure transaction volumes from NoteStandard's user base. We look forward to your positive review and are ready to initiate Sandbox API evaluations immediately.

Yours faithfully,

NoteStandard Technologies Team
Lagos, Nigeria.

3. Executive Summary

This document presents a structured framework for a strategic partnership between NoteStandard Technologies and Zenith Bank Plc. In today's corporate environment, companies face severe fragmentation in their digital toolchains. Collaborative teams use separate apps for messaging, document editing, and online calls, which raises subscription costs and exposes data to security vulnerabilities.

NoteStandard solves these issues by providing a unified, secure system. We combine real-time communication modules (chat, status updates, calling) directly with database-backed documentation structures. By focusing on defensive programming, client bundle optimization, and database connection pooling, we have built a stable software infrastructure ready for enterprise scaling.

Key Objectives of the Partnership:

- Secure operating accounts with Zenith Bank to manage corporate operations, payroll, and reserves.
 - Integrate Zenith Bank payment checkout gateways directly into NoteStandard's subscription module.
 - Configure webhook communication systems to automate real-time billing reconciliation.
 - Partner with Zenith Bank's technology division to explore future virtual accounts and cross-border settlement channels.

A partnership between NoteStandard and Zenith Bank aligns modern productivity software with robust commercial clearing systems. The integration ensures that all user actions—from invoice collection to daily ledger updates—are processed directly by Zenith Bank's secure banking APIs.

The commercial value is mutual: NoteStandard obtains a Tier-1 clearing partner, guaranteeing fast transaction speeds and high compliance oversight, while Zenith Bank establishes itself as the primary treasury holder and payment processing channel for NoteStandard's growing user base.

Proposed Partnership Phases:

- **Phase 1: Operational Base (Months 1–3)** — Setup corporate banking lines and deploy merchant payment checkouts.
- **Phase 2: Reconciliation Automation (Months 4–6)** — Link automated webhooks to process payments and ledger reconciliation.
- **Phase 3: Deep API Integration (Months 7+)** — Integrate virtual accounts and treasury APIs (subject to approvals).

**Screenshot Placeholder: Subscription Dashboard & Billing Area**

(Will display high-resolution application screen mockups in final render)

4. Company Profile

NoteStandard Technologies is a software firm specializing in real-time communication, document databases, and productivity solutions. Founded on principles of disciplined software architecture and information security, we build applications that help modern organizations collaborate.

Unlike platforms that rely on third-party integrations, NoteStandard is built natively on a unified relational database schema. This design ensures that text messages, files, documents, calls, and status updates are linked in one system. This architecture reduces database lookup latency, prevents sync failures, and allows granular access controls.

Corporate Governance & Philosophy:

- We do not exaggerate metrics, valuations, or active licenses.
 - We design platforms to be secure by default, using industry-standard cryptography.
 - We support regulatory compliance, designing features to align with NDPR/GDPR privacy guidelines.

NoteStandard Technologies is structured to scale responsibly, separating roles across software engineering, quality assurance, customer support, and finance. While currently operating as a private growth-stage firm, the company is establishing corporate partnerships to prepare for larger enterprise deployments.

Our primary market opportunity is providing secure collaboration environments for professional services (such as legal and financial advisories), distributed engineering teams, and remote educational institutions. These sectors require strict data privacy, auditable collaboration records, and reliable communication links.

Company Details:

- **Headquarters:** Lagos, Nigeria
 - **Primary Sector:** Enterprise Productivity & Digital Communications
 - **Revenue Model:** Software-as-a-Service (SaaS) Subscriptions & API Licenses
 - **Contact Email:** partnerships@notesstandard.com
 - **Website:** <https://notesstandard.com>

5. About NoteStandard Platform

The NoteStandard platform is designed to replace fragmented collaboration stacks. Instead of running separate applications for messaging, document editing, and calls, teams access all tools within a single interface. This consolidated approach improves productivity and ensures data consistency.

Available Client Environments:

- **Web Application:** A responsive, secure React application compiled with TypeScript, optimized for modern desktop browsers.
- **Android Native APK:** A native mobile application utilizing specialized push notification handlers and Agora calls.
- **iOS PWA:** A lightweight Progressive Web App utilizing service workers for local storage and notifications.

Screenshot Placeholder: Web Client Landing Interface

(Will display high-resolution application screen mockups in final render)

Technical and Performance Optimization:

To support users in areas with constrained mobile networks or slow internet connections, NoteStandard has implemented several optimization strategies:

- **Advanced Code Splitting:** We separated external libraries (such as the Agora video engine and charting libraries) into lazy-loaded code chunks. This reduced the initial page bundle from 805 KB down to 224 KB (67 KB gzipped), enabling fast page load times.
- **TCP Port Keep-Alive:** Outbound HTTP/HTTPS and database database engines utilize persistent socket agents. This prevents TCP Port Exhaustion under high concurrency, maintaining system stability.
- **API Response Compression:** Express servers apply Gzip compression to JSON payloads larger than 1 KB, reducing API transfer overhead by up to 80%.

Screenshot Placeholder: Vite Code-Splitting Bundle Optimizer Log

(Will display high-resolution application screen mockups in final render)

Media Offloading & Storage Architecture:

To prevent large files from exhausting server bandwidth, NoteStandard offloads all media attachments, voice notes, and APK installers to cloud storage buckets:

- **Direct Storage Uploads:** Chat attachments, media uploads, and document resources are stored directly in Cloudinary and Supabase storage buckets, bypassing application server queues.
- **Pre-Signed APK Downloads:** When a user downloads the Android APK, the server issues a 302 HTTP Redirect to a secure, 1-hour pre-signed Supabase Storage link, reducing direct server bandwidth.
- **Long-term Public Caching:** Un-hashed public files (such as notification sounds, favicons, and public mockups) are served with long-term 30-day Cache-Control headers, preventing repetitive browser requests.

Screenshot Placeholder: Storage Controller & Pre-signed URL Redirect Logs

(Will display high-resolution application screen mockups in final render)

6. Platform Modules Walkthrough

1. The Chat & Instant Messaging Module

NoteStandard's messaging client is powered by Socket.io, providing full-duplex communication. Features include instant text delivery, attachment transfers, presence tracking, and real-time read receipts. The module handles high concurrency safely by authorizing WebSockets during the handshake phase.

2. The Collaborative Notes Module

The notes editor allows users to generate structured knowledge databases. It supports folder organization, dynamic category tagging, document sharing, and PDF export capabilities. All documents are stored in normalized database tables, ensuring data integrity.

Screenshot Placeholder: Messaging Console & Rich-Text Notes Workspace

(Will display high-resolution application screen mockups in final render)

3. The Platform Feed Module

The Feed serves as a team bulletin board. It allows administrators and team leaders to post announcements, share links, upload images, and moderate team comments. This module helps organizations distribute notices quickly without relying on external email chains.

4. The Ephemeral Status Module

NoteStandard includes a Status Tray at the top of the chat area, displaying 24-hour disappearing photo and video stories. The status viewer is optimized with automatic progress indicators, chronological segments, and video-ended event handlers to sync story playback.

Screenshot Placeholder: Platform Feeds & Status Creator Interface

(Will display high-resolution application screen mockups in final render)

5. The Agora Call Module

NoteStandard integrates real-time calling directly into chat channels using the Agora RTC SDK. Users can start voice or video calls inside their conversation threads. Because calling runs over a peer-to-peer WebRTC connection, call traffic is offloaded from the server, minimizing hosting bandwidth.

6. Security & Custom Settings Module

Each user can access a security settings panel to configure multi-factor parameters, view active login sessions, reset credentials, and configure notifications. These options help users protect their accounts directly from the client interface.

Screenshot Placeholder: Active Call Window & Settings Dashboard

(Will display high-resolution application screen mockups in final render)

7. User Interface Desktop Scroll & Layout Fixes

To ensure the application is usable on low-resolution desktop monitors and laptop screens, the layout was updated to prevent viewport overflow. Flexbox containers are constrained using min-height parameters (`min-h-0`) and custom scrollbars. This guarantees that users can scroll their chat lists and document directories at any browser zoom level without layout breaks.

8. System Boot & Database Resilience Gates

During server startup or database updates, NoteStandard uses a "boot kernel" to manage requests. If the database is busy, the API gateway returns a `SYSTEM\_BOOTING` code. The client automatically queues requests and retries them, preventing app crashes during brief maintenance windows.

Screenshot Placeholder: Desktop Responsive Layout & Boot Kernel Log Output

(Will display high-resolution application screen mockups in final render)

Platform Modules & Technical Capabilities:

Module Name	Core Technology	Operational Status	Integration Dependency
Instant Chat	Socket.io / Node.js	Fully Live	Internal Socket Gateway
Notes Editor	React Draft / PostgreSQL	Fully Live	Primary Database Pool
Feeds Board	Express API / Supabase	Fully Live	Media Storage Bucket
Status Trays	HTML5 Media / Cloudinary	Fully Live	CDN Upload Pipeline
Voice & Video	Agora SDK / WebRTC	Fully Live	External Agora Engine
Account Manager	JWT / Bcrypt / Redis	Fully Live	Redis Token Ledger

7. User Journey Map

The user experience on NoteStandard is designed to be direct and secure. First-time users register with verified email verification gates, explore their collaborative dashboard, and can subscribe to access advanced productivity and communication features.

User Journey Step Flow

User Journey Step Explanations:

- **1. Register:** Registering an account using secure password hashing and form validation.
- **2. Verify Email:** Verifying the user's email via one-time tokens to prevent automated spam signups.
- **3. Login:** Logging in securely.

● 5. Subs

8. Current Payment Flow

NoteStandard's subscription management system uses secure API gateways to process payments. When a user chooses a plan, the client initiates a secure checkout session, and the server relies on real-time webhooks to provision premium workspace features.

Our payment verification uses double-entry checks: first, when the gateway returns a client-side success response, and second, when the backend receives a cryptographically signed webhook directly from the payment processor. This prevents unauthorized database modifications and duplicate transactions.

Screenshot Placeholder: Subscription Checkout & Receipt Display

(Will display high-resolution application screen mockups in final render)

Current Payment & Activation Loop

Current Flow Verification Steps:

- **1. Card Checkout Isolation:** The checkout page opens in a secure frame, keeping card data isolated from NoteStandard.
- **2. Webhook Event Reliability:** Webhooks verify transactions even if the user closes their browser before redirection.
- **3. Idempotent Updates:** The database utilizes strict unique constraints on transaction IDs to prevent double credits.
- **4. Automatic Receipt Delivery:** Digital receipts containing breakdown data are sent automatically to users.

9. Future Banking Integration Flow

Through our proposed partnership, NoteStandard intends to integrate Zenith Bank's digital payment gateways directly into the platform checkout layer. This integration will replace secondary gateways with direct Zenith Bank clearing services.

By connecting directly with Zenith Bank APIs, NoteStandard can automate fund collections and reconciliation logs. When users purchase license extensions, the platform initiates a direct API call to Zenith Bank, which processes the transaction and returns a settlement webhook, transferring funds directly to our corporate accounts.

Screenshot Placeholder: Proposed Zenith API Checkout Integration (Mockup)

(Will display high-resolution application screen mockups in final render)

Proposed Zenith Bank Core Integration Flow

Zenith Bank Integration Advantages:

- **1. Lower Processing Costs:**
Removing secondary gateways decreases processing fees per transaction.
- **2. Direct Settlements:**
Settlements are cleared directly into Note Standard's corporate operating account, improving cash flow.
- **3. Cryptographic API Keys:**
Using Zenith Bank's digital signature tokens ensures secure authentication.

on.

4. Dynamic State Management Auditng : We

can design automatic reconciliation scripts to match billing ledger servers with bank statements.

10. Merchant Collections Flow

NoteStandard plans to introduce B2B features, allowing professional merchants and corporate accounts to generate client invoices and collect payments directly within their shared document workspaces.

Under this planned structure, the merchant creates an invoice item within a shared notes node. The customer receives a notification and authorizes the payment through the Zenith Bank merchant collections gateway. Once Zenith Bank captures the funds, they are settled directly to the merchant's account after platform fee deductions, all within Zenith Bank's secure network.

Screenshot Placeholder: Merchant Invoice Generator & Payment Window

(Will display high-resolution application screen mockups in final render)

B2B Merchant Collection & Settlement Flow

Proposed Merchant Capabilities:

- **1. In-Context Invoicing:**
Invoice objects are embedded in collaborative workspace folders, keeping billing in context.
- **2. Multi-channel Payments:**
Zenith Bank's collections APIs process card payments and bank transfers.
- **3. Automated Status Sync:**
Ledger updates notify both parties instantly when payments clear.
- **4. File**

xible Clearing Rules:
Escrow settlement terms can

be configured to hold funds until work milestones are confirmed.

11. Subscription & Billing Flow

NoteStandard manages subscription lifecycles using database ledgers. Rather than recalculating user permissions on every request, client privileges are governed by token states cached in Redis. When a subscription is renewed or modified:

- **Step 1: Webhook Receipt** — The checkout gateway triggers a secure webhook event.
- **Step 2: Cryptographic Audit** — The server validates the webhook signature using secret signing keys.
- **Step 3: Database Commit** — The database logs the transaction ID and updates the company's license record.
- **Step 4: Redis Cache Invalidation** — The backend updates the user session cache in Redis, updating permissions instantly.
- **Step 5: Client Interface Update** — The client app receives a socket event and updates the workspace view.

Screenshot Placeholder: Subscription State Machine & Ledger Tables

(Will display high-resolution application screen mockups in final render)

12. System Architecture

NoteStandard is built on a clean service-oriented architecture designed to handle concurrent users with low latency. By separating client interface code, socket routers, and database systems, the platform minimizes single points of failure.

All API routes operate statelessly, allowing the backend to scale across multiple container nodes behind a load balancer. Real-time notifications and messages run over dedicated Socket.io gateways, while heavy media streams are offloaded directly to Cloudinary and Supabase CDN networks.

Core Architecture Features:

- **REST API Gateway:** stateless Node.js services routing HTTP requests and validating auth tokens.
- **Real-Time Engine:** handles persistent WebSocket connections to sync notes and messages.
- **Relational Database:** PostgreSQL database utilizing connection pooling to prevent query queuing.

13. Security Architecture

The NoteStandard security framework protects user and transaction data at every level of the application stack. All communication with our servers is encrypted in transit using TLS 1.3, and database systems encrypt sensitive values at rest using AES-256.

User authentication uses JSON Web Tokens (JWT) signed with rotating keys. Sockets and API endpoints require token checks before processing requests. Granular access controls are enforced at the database level, preventing users from accessing unauthorized documentation, messages, or payment data.

Our Security Objectives:

- **1. Data Confidentiality:** Prevent unauthorized users from intercepting workspace communications.
- **2. Audit Trail Integrity:** Ensure transaction logs, documentation, and chat histories cannot be altered.
- **3. Session Verification:** Confirm the identity of users and servers before authorizing API operations.

Secure Application Flow Architecture

Corporate
Security Controls
Matrix:

Threat Vector	Security Control Measure	Implementation Status
Eavesdropping	TLS 1.3 Transport Encryption	Fully Implemented
SQL Injection	Query Parameterization & ORM layer	Fully Implemented
XSS Attacks	DOMPurify HTML input sanitization	Fully Implemented
Session Hijack	Stateless JWT with rotated sign keys	Fully Implemented
Brute Force	Express rate-limiters & IP blocks	Fully Implemented
Database Theft	AES-256 encryption at rest	Fully Implemented

14. Compliance & Governance

NoteStandard Technologies operates under a structured governance framework, ensuring compliance with data privacy laws and digital standards. We align our data collection and storage policies with the Nigerian Data Protection Regulation (NDPR) and the General Data Protection Regulation (GDPR).

Our platform is designed with modular identity management nodes, preparing us to integrate KYC and AML validation protocols when transaction features are introduced. When Zenith Bank APIs are integrated, NoteStandard will route BVN/NIN verification through Zenith's secure clearing infrastructure, maintaining compliance with Central Bank standards.

Compliance Objectives:

- **1. Data Privacy:** Ensuring user data is stored within legal borders, using encryption for all off-platform transfers.
 - **2. KYC Readiness:** Preparing user identity checks to align with financial transaction compliance.
 - **3. Independent Audits:** Maintaining detailed access logs to support security audits.
-

Compliance Readiness Assessment:

Regulation	Requirement Details	NoteStandard Status
NDPR (Nigeria)	Consent logs & secure data storage	Fully Compliant
GDPR (Europe)	Right to erasure & export parameters	Fully Compliant
KYC Standards	Identity verification & BVN checks	Ready for API integration
AML Directives	Transaction logs & alerts	Ready for API integration
PCI-DSS	Card security (handled by Zenith)	Gateway dependent

Enterprise Risk
Management (ERM):

Risk Area	Impact	Proactive Mitigation Strategy
Cybersecurity	High	JWT tokens, database parameterization, secure env configs.
Downtime	Med	Redundant cloud servers and database pool monitoring.
Compliance	Med	Data privacy compliance and legal reviews.
Fraud	High	Idempotent ledgers, token audits, webhook signatures.

15. Technology Stack

NoteStandard is built on a modern technology stack, combining standard enterprise frameworks with optimized libraries to deliver performance and scalability.

Core Architecture Technologies:

Layer	Technology Used	Purpose & Optimization
Frontend	React v18, TypeScript, Tailwind	Single Page Application with 224 KB entry size.
API Server	Node.js, Express, Socket.io	Stateless request routing and Socket connections.
Database	PostgreSQL (pg-pool)	Relational database utilizing connection pooling.
Cache	Redis Cache Engine	Stateless session storage and permission limits.
Media/Calls	Agora RTC Engine, WebRTC	Low-latency peer-to-peer audio and video calls.
Storage	Supabase, Cloudinary	Offloads asset bandwidth from main servers.

16. Banking Requirements

To support our corporate scaling and prepare for digital collections, NoteStandard Technologies requires core banking services from Zenith Bank Plc. This relationship will support our daily business operations and payment integrations.

Our primary requirement is establishing corporate operating accounts to manage payroll, tax holdings, and operating reserves. We also seek to integrate Zenith Bank's merchant payment gateways, enabling automated subscription billing and settlement reconciliation directly through our platform.

Primary Banking Demands:

- **1. Corporate Operating Accounts:** Operating accounts for treasury, tax reserves, and payroll.
- **2. Merchant Gateway Collections:** Zenith payment checkout integration in our checkout workspace.
- **3. Automated Settlements:** Daily clearing and settlement of processed subscription payments.
- **4. Virtual Account APIs:** For future deposit matching (subject to regulatory approval).

Corporate Banking Requirements Summary:

Requirement Group	Operational Purpose	API Integration Need
Corporate Accounts	Treasury management, payroll, and reserves	None (Standard Web Banking)
Merchant Gateway	User card checks and checkout collections	High (Zenith Checkout SDK)
Webhook Settlements	Automate ledger updates when payments clear	High (Zenith Webhook API)
Virtual Accounts	Automated deposit matching and B2B billing	Medium (Zenith Virtual Accts)
Support Services	KYC audits, security reviews, and API support	None (Dedicated Manager)

17. Partnership Roadmap

To manage technical risk and ensure security, we propose a phased roadmap for integrating NoteStandard's software with Zenith Bank's clearing networks. This approach allows both engineering teams to test interfaces safely before deploying to production.

We begin with basic corporate account onboarding and payment checkout configuration. We then move to webhook integration for automated accounting. Finally, we explore advanced digital banking tools, such as dynamic virtual accounts, to support our corporate clients.

Integration Timelines:

- **Phase 1: Setup (Months 1–3)** — KYC verification, corporate account setup, and sandbox gateway access.
 - **Phase 2: Automation (Months 4–6)** — Reconciliation script deployment, sandbox testing, and production checkout launch.
 - **Phase 3: Scaling (Months 7+)** — Virtual account integration (subject to approvals) and joint B2B marketing.
-

Phased Partnership Implementation Timeline:

Phase	Primary Goal	Technical Milestones	Target Completion
Phase 1	Account Setup & Sandbox	KYC checks, API keys, Checkout staging	Month 3
Phase 2	Automated Reconciliation	Webhook scripts, ledger audits, Go-Live	Month 6
Phase 3	Advanced Integrations	Virtual accounts setup, joint marketing	Month 12+

Screenshot Placeholder: Proposed Integration Timeline Roadmap Chart

(Will display high-resolution application screen mockups in final render)

18. Why Zenith Bank?

NoteStandard has selected Zenith Bank Plc as our preferred banking partner due to direct compatibility between our software standards and Zenith's digital banking capabilities.

Zenith Bank's infrastructure provides the transaction processing speeds required to support NoteStandard's real-time messaging and documentation modules. The bank's compliance with international ISO security standards aligns with our data encryption and access control protocols.

Partnership Synergy:

- **1. Performance Compatibility:** Zenith Bank's digital APIs match NoteStandard's real-time performance requirements.
 - **2. Technical Security:** Shared focus on information security, database audits, and encryption.
 - **3. Scalability:** Zenith Bank's capacity to process high transaction volumes supports our scaling targets.
 - **4. Fintech Focus:** Zenith's experience in supporting tech startups ensures efficient operational support.
-

19. Technical Appendices

Appendix A: Technology Stack Overview

NoteStandard is built on a clean Node.js and React architecture designed to minimize server load. Sockets manage messaging, database pools prevent query queuing, and cloud storage hosts heavy files and native APK downloads. This design keeps the application stable under high user volume.

Appendix B: High-Level API Integration Overview

NoteStandard plans to integrate Zenith Bank's Checkout SDK within our client payment panel. The integration uses a secure frame to prevent card data from reaching our database. The backend uses webhooks to receive transaction updates and update user permissions in Redis.

Appendix C: Data Flow Summary

User data is partitioned and encrypted. Payment requests are sent securely to the bank, and settlement logs are reconciled automatically using daily ledger exports.

Regulatory Compliance Checklist:

Compliance Area	Regulatory Target	NoteStandard Action
Data Sovereignty	NDPR Compliance directives	Encrypted local PostgreSQL records
User Privacy	GDPR delete/export protocols	Account erasure buttons in dashboard
Secure Sockets	TLS 1.2+ transport policies	Enforced HTTPS and token headers
Reconciliation	Idempotent transaction logging	Independent ledger tables matching webhooks
Audit Logging	System access track trails	Immutable server security logs

Screenshot Placeholder: System Security Compliance Logging Panel

(Will display high-resolution application screen mockups in final render)

20. Technical Glossary

- **Agora SDK:** A secure real-time audio/video engine establishing low-latency connections.
 - **Client Bundle:** The compiled JavaScript, CSS, and HTML assets downloaded by client browsers.
 - **Code Splitting:** Splitting application code into smaller chunks that load only when needed.
 - **JWT Token:** Stateless, cryptographically signed tokens used for API and WebSocket authorization.
 - **Postgres Connection Pool:** A cache of open connections reused for queries to prevent CPU overhead.
 - **TCP Keep-Alive:** Persistent HTTP/HTTPS agents that prevent TCP connection failures.
 - **Native Wrapper:** A lightweight wrapper to run web applications natively on mobile and desktop platforms.
 - **Socket.io:** Secure web communication protocol providing full-duplex messaging links.
 - **Supabase Storage:** A cloud hosting layer used to store large assets, offloading bandwidth from servers.
-

21. Contact & Closing Information

We appreciate your time in reviewing this strategic banking partnership proposal. NoteStandard Technologies is committed to establishing a reliable operational relationship with Zenith Bank Plc, combining secure digital collaboration tools with premier commercial banking networks.

We look forward to Zenith Bank's feedback and are ready to schedule a kickoff meeting to discuss the integration roadmap.
